

Implementing POI's in Google Maps UI Documentation.

By default our google maps UI will display every POI, "Point Of Interest" on our map but they will not provide any information or prompt any further abilities when clicked on. I have implemented clickable POI's into our map.

While researching different approaches to designing the layout of our application as well as the various pins and POI's, I came across a feature that will allow us to only display restaurants across our map. By using the "visibility" feature we can toggle whether we want other points of interest such as businesses, schools, parks, etc. to even display on our maps. Since this app primarily focuses on selecting different Restaurants we can disregard the rest of the locations to make POI selection much simpler.
